Projeto Sistemas Distribuidos

Engenharia Informática Universidade do Minho 2019/2020

Objetivo

- Criar uma plataforma de partilha de ficheiros de música, através da implementação do modelo cliente/servidor.
- Utilização de sockets e threads em Java.
- Controlo da concorrência (Numero de operações em simultâneo)

New Features!

- Import a HTML file and watch it magically convert to Markdown
- Drag and drop images (requires your Dropbox account be linked)

You can also:

- Import and save files from GitHub, Dropbox, Google Drive and One Drive
- Drag and drop markdown and HTML files into Dillinger
- Export documents as Markdown, HTML and PDF

Markdown is a lightweight markup language based on the formatting conventions that people naturally use in email. As John Gruber writes on the Markdown site

The overriding design goal for Markdown's formatting syntax is to make it as readable as possible. The idea is that a Markdown-formatted document should be publishable as-is, as plain text, without looking like it's been marked up with tags or formatting instructions.

This text you see here is *actually* written in Markdown! To get a feel for Markdown's syntax, type some text into the left window and watch the results in the right.

Tech

Dillinger uses a number of open source projects to work properly:

- AngularJS HTML enhanced for web apps!
- Ace Editor awesome web-based text editor
- markdown-it Markdown parser done right. Fast and easy to extend.
- Twitter Bootstrap great UI boilerplate for modern web apps
- node.js evented I/O for the backend
- Express fast node.js network app framework @tjholowaychuk
- Gulp the streaming build system
- Breakdance HTML to Markdown converter
- iQuery duh

And of course Dillinger itself is open source with a public repository on GitHub.

Installation

Dillinger requires Node.js v4+ to run.

Install the dependencies and devDependencies and start the server.

```
$ cd dillinger
$ npm install -d
$ node app
```

For production environments...

```
$ npm install --production
$ NODE_ENV=production node app
```

Plugins

Dillinger is currently extended with the following plugins. Instructions on how to use them in your own application are linked below.

Plugin	README
Dropbox	plugins/dropbox/README.md
GitHub	plugins/github/README.md
Google Drive	plugins/googledrive/README.md
OneDrive	plugins/onedrive/README.md
Medium	plugins/medium/README.md
Google Analytics	plugins/googleanalytics/README.md

Development

Want to contribute? Great!

Dillinger uses Gulp + Webpack for fast developing.

Make a change in your file and instantanously see your updates!

Open your favorite Terminal and run these commands.

First Tab:

\$ node app

Second Tab:

\$ gulp watch

(optional) Third:

```
$ karma test
```

Building for source

For production release:

```
$ gulp build --prod
```

Generating pre-built zip archives for distribution:

```
$ gulp build dist --prod
```

Docker

Dillinger is very easy to install and deploy in a Docker container.

By default, the Docker will expose port 8080, so change this within the Dockerfile if necessary. When ready, simply use the Dockerfile to build the image.

```
cd dillinger
docker build -t joemccann/dillinger:${package.json.version} .
```

This will create the dillinger image and pull in the necessary dependencies. Be sure to swap out \${package.json.version} with the actual version of Dillinger.

Once done, run the Docker image and map the port to whatever you wish on your host. In this example, we simply map port 8000 of the host to port 8080 of the Docker (or whatever port was exposed in the Dockerfile):

```
docker run -d -p 8000:8080 --restart="always" <youruser>/dillinger:${package.json.version}
```

Verify the deployment by navigating to your server address in your preferred browser.

Kubernetes + Google Cloud

See KUBERNETES.md

Todos

- Write MORE Tests
- Add Night Mode
